## Harness the Power of Win-Situ 2000... ...in YOUR Pocket!

**POCKET-SITU uses the POCKET PC interface!**

**Pocket-Situ** is a NEW ultra portable user interface for In-Situ instruments. Running on the Compaq Pocket PC, it is part of the new generation of lightweight, powerful products from In-Situ.

Pocket-Situ stands apart from ALL others as a fully functional instrument control and data management tool. We have taken all of the features of our popular Win-Situ 2000 and made them ultra-portable. Features like

real-time readings, graphing, data downloads, remaining battery life and more.

It's also a fully functional PDA, which means that it can run all of the popular Pocket PC software.

Customize each parameter and set display units, set up tests, download data and view reports or graphs all in the palm of your hand! With Pocket-Situ, you can define and

monitor up to 16 tests. Intuitive Wizards guide you through each operation—including test setup and calibration. Tests options include linear, linear average, logarithmic or event sampling modes.

Forget taking a PC to the field—take it in your pocket!

## Pocket-Situ

### Features

- Intuitive tree organization of instruments, parameters and tests
- Convenient readouts display remaining memory and battery voltage
- Take instant readings.
- View graphs or reports
- Convenient wizards guide every operation
- Achieve maximum accuracy with compensation for gravitational acceleration and fluid density
- Easy-to-read icons display status of tests
- 'Smart' data download feature only downloads new data, saving you time
- Select your choice of units for most measurements
- Assign a unique name to each logger in a network

### Test Types

Pocket-Situ's flexible test modes allow for quick test configurations. Four types of tests are available:

#### Linear

Measurements are evenly spaced over time, at intervals from 0.5 seconds to one week depending on device type.

#### Linear average sampling

Filters out turbulence by recording the mean of multiple, closely-spaced measurements. This is an option when measuring pressure and temperature with a miniTROLL or TROLL 8000.

#### Logarithmic

This test type begins by taking probe measurements as fast as possible. The sampling rate gradually slows at a logarithmically decaying rate.

#### Event Sampling

Event-based tests are much like linear schedules with one important difference. The probe is measured at a user-defined interval, but measurements are stored to memory only if they exceed the user-defined value.

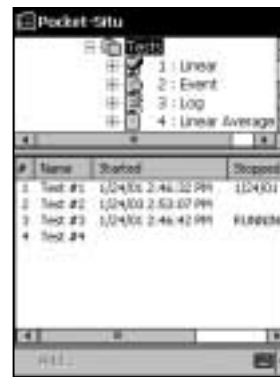

### Pocket-Situ screens

Select the device to display its information including remaining battery and memory.

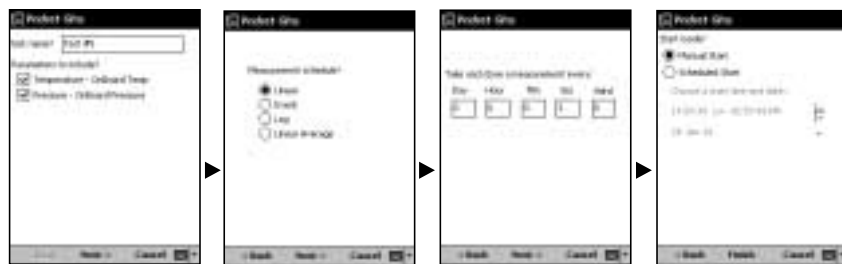

Take instant readings and customize the display of each parameter.

A single device can be set up to run and store multiple tests.

### NEW! Test Wizard - here's how it works:

- 1** Select the Test Wizard. Enter a name for the test and select the parameters to monitor
- 2** Select the Type of test. Testing modes include Linear, Event, Log or Linear average.
- 3** Define the storage interval in days, hours, minutes, seconds and even hundredths of a second.
- 4** Choose to start the test manually or schedule a date for the unit to start automatically.

### It Makes Sense To Use the Pocket PC! Now with FULL COLOR Display!

The Compaq Pocket PC is designed for mobile professionals who need to get data from the field quickly. The ultra-thin Pocket PC is very convenient to carry and simple to use. In this fast paced world, people today are
